Abstract: *The modern ways of living as well as using of goods and the contribution of industrialized world and new technologies have the consequences to the nature and the environment. The energy and the industrialized section and other transportation means in the process of energy transforming release the pollutants. The impact is the most destructed in GHG emission and others liquid and solid meters which destroy the environment and polluted water and the soil. The convections and protocols (UN, Kyoto and others) which are obligated to reduce the GHG emissions in developed countries is the first step to control the pollution in our planet.*

The paper is the overview of the current situation in the section of protection of the environment and the ecological consequences by industrialization. The main goal is to push the relevant institution and other subjects which are directly involved in the urban planning and in the sphere of industrialization, to have more responsibility for ecology and protection of the environment.

Keywords: ENVIRONMENT, GHG EMISSION, PROTECTION, ECOLOGY

1. Introduction

If existence is a natural phenomenon, which literally means universal existence in order, then human existence as a cultural activity and conscious voluntary act - means survival in another and different order and the order in which the foundation built plan and planning. Building and brickwork on the most specific phenomena creates something that is out of the biological and physiological cycle. Namely, it creates a unique anthropological phenomenon civilization.

Civilization of the unnatural and supernatural way stops the cyclical balance, forcing awareness of the world's Rights managed line of history was essentially dominated by the concept favorably called progress or stepping forward. But every man's thesis is shaped by antithesis : Progress and Regress in terms of "walking forward" doesn't "stepping back"?!

One thing is however indisputable, in modern industries of civilization no longer walking but take off and nuclear planetary launching: Homo Sapiens- Man is launched in interplanetary space to build new buildings outside the home planet, in which still respect buildings of ancient cultures, with the task to preserve the tradition of protecting museum exhibitions that are based on historical memory.

2. Importance of planning in protecting the environment

Historical culmination of that progress is anthropological phenomenon of modern mechanical civilization explosion on all levels which is marked by the one and only unbearable interplanetary technology. We won and remodeled the visible and invisible world. The man takes the role of a builder, disturbing the natural balance. Civilization itself is already far from the innocent meaning of humanity. Yet still, even now most civilizations are based on what is essential from the very beginning, which establish the complex phenomenon – the nature. All this is irretrievably lost, if not lost from the big builders plan, slowly losing itself from small urban planning, losing breath and positive urbanism. We have the impression that builders are losing control; in fact, more pushed another, perhaps still invisible universal control of the world's power brokers. However, this is not entirely new reality. None of us is guilty, we all builders and residents on this planet; we are participants in the contemporary awful, but wondrous civilization.

We must accept that our country and our area seem meaningful and quickly exerted a plan in which participating cities and crowded urban areas, that generate chemical toxins too much, insoluble plastics, die-soluble perilous nuclear waste, a new inevitable matter, that eating the nature or the divine balance at all levels from earth, soil, air to the protective ozone roof. If we must soberly face this existential phase, basically, it seems to be the last, and to engage in the modern plan of modeling the planet with the will to preserve the most precious thing of old values, at least. Today, if it is already impossible tomorrow. Our generation, especially our generation expert, not only testimony to this revolutionary century and the revolutionary leap, but our professional generation have the honor to participate in this wonderful leap in modern times. It is easy to meditate, to contemplate, to observe, but it is difficult and painful in every sense; to participate in the building to participate and build in the entire load history with imposed policies, ideologies, economies, bureaucrats and technocrats. This generation has a professional honor and guilt to destroy the natural space, to break down the fragile remnants of the former residence, to assume the risk of political and ideological principles of the various initiatives, the range has to deal with inadequate fabrication, to build fast buildings, crowded with residents, to be deducted from the pastoral landscape, etc.

But, the old sages say every man and noblest and most accomplished, once the act is guilty, builder man destroys the natural integrity decent, but forced countless other conditionality, the breaking down and his own ethical integrity.. But is it a man, first man builder and creator who will assume the risk and act passionately focused despite awareness that can fall into error ?! At the same time he left the new builder, a descendant of the great master Dedal, than to conform and to include in the plan of modern civilization, which all prophets prophesized as eschatological be involved in building an ecumenical maze that is inevitably placed Temptation of human existence. Maze that govern global, planetary corporations in the name of the single real god- Capital.

On which way we participants in the planning and building can participate in the great plan of the almighty capital?! How to use the moment to shape our region or our cities, according to modern civilization?!

Without nostalgia and sobering we should accept the contents of humanity and to engage in reality as it is. However, although it is frightening universal builders plan to try in our intimate micro planning to be more constructive than destructive. What continues to plan and specifically to act? Fundamentally changed the social

and political conception of the Republic of Macedonia, I think that is imposed not only necessary, but inevitable necessity of forming a special professional and scientific body that would take yeah compound builders task to examine, to investigate, evaluate and correct the "old" structures and to plan, create, to enrich the solutions conceived all "lines" of space, both physical and spiritual sense.

It is clear that such a professional and scientific research, planning and design is a continuous process that must be carried out on two levels: - one under the spheres that are of specific scientific and creative interests of the building, another - by the interests of establishing important relationships in the space of material and spiritual spheres. Shown in the scheme, the Investigative creative scientific process will move right, but forward (from simple to more complex structures builders) in which spherical will be situated nuclei of the special space-urban areas. It is known that such a complex activity can be carried out by a consequential scientific methodology, that methodology is not applied partially dispersed and intuition, but must concentrate in special, figuratively speaking; the institute has a scientific staff of more profiles of several levels of professional scientific work. This body will have the opportunity to train, fulfilled, and improved model of its potential and brings people and adopt appropriate technology.

Equally this form of action will be able to give momentum to expanding and deepening scientific achievements metophology according Nachnite, architectural, urban, planar and of course according to the social potential for technological enrichment.

World and our knowledge of organizing such a complex body, flexible and dynamic, yet united with a tested methodology that consistently build and such specialized experts, suggest the most suitable for this purpose formation scientific core or institute.

Why such a suggestion. We know that with scientific institutions the level of knowledge can be only controlled, the recognition of talent, to examine the area for specific scientific areas, talents IA research and creative work, sense of cooperation, vision and power to achieve ideas. At the same time, these institutions allow the accumulation of modern technology, fast tracking of changes and effectively connecting with the world scientific systems. Also, the institution has the opportunity to participate in scientific achievements in the form of permanent studies in domestic and international centers of knowledge.

These institutions pledge to continually climb the ladder of scientific and vocational education, which requires strict, but in any case bureaucratic, but discipline, the motivation for scientific results rounded to a single coordinated creative work. All this could be the content and essence of such an institution to the theory of planning. Which of course will become dominant as coordinator and consultant in building practice .The scientific core will be based on more types of builders and planning vertically and horizontally? The scientific core will have power to monitor overall activity and responding to act as theoretically and practically. From here it is quite conceivable that the priority of such imagined center will be one extremely serious, complex and unifying activity - **Ecology**.

Under ecology mean extremely thought out planning, building and generally making the entire home space for the common good and nice life. The etymology has the logic design of a home under high humanitarian standards and principles. Everyone is clear that deliberate properly and efficiently performed ecology, represents the future, secured and safe for an entire community over generations indefinitely. Ecology is not just a concern for recreational space, or just taking care of wild and domestic animals and keeping clean and innocent nature, rather than what can be addressed to construction intervention in this civilization was forced to invent nature. But, this violence must wise and proper to calculate through economical, logical and humanitarian planning of all future generations. At the present time, the space should be created according to the nature and social dynamics, according to

the principles of human helpful, good and nice. In fact, since the old times, the architecture represents the highest and most responsible science that depends on quality, its unique dimension noble urban or rural residence, which is an inevitable condition for steady state and society successfully.

Since, it appears that the institute would be base on the universal removal and current problems of space's building. For these important fateful issues scientific core will draw up programs and concepts performed on strong fundamentals and reliable information and expert systems developed, and will pursue scientific determinants of creative architecture and it's building the structures. On the other hand sets will examine the necessary harmony of macro-determinant in space (arrangement of infrastructure, energy, communications, demographic, sociological, etnonacionals and other determinants that should be under the control of planning and commitment of the state). Exact activities will be carried out through analysis and computer simulation models of regional and urban spatial patterns.

3. Conclusion

This paper is perhaps a little philosophical view of past practice for usurpation of natural resources that nature gave us. Industrialization and technological development as achievements of modern life should not be an excuse for destructive behavior towards the environment. The last few years, attention to environment goodness of meaning, so that every time their decision to seek to impact on the environment is minimal. Sustainable development becomes imperative and philosophy of life for present and future generations in order to provide resources and opportunity to our children and grandchildren to enjoy the benefits of the modern world and technological development.

Therefore, need is to raise awareness of every individual, as well as the personnel and society, especially the responsible structures for deciding individual industrial or commercial activities in the country. It can be concluded that this scientific structure will be able to accept responsibility certain and complete to enable the urban construction and architectural firms and institutes programs for optimal development and practical performance. At the same time, the expert - scientific council will have the responsibility to perform arbitration on a wide basis through the organization of competitions for regional, urban, location and other solutions, which will provide a high degree of objectivity and certainty in the valuation.
